

Stage Frame & Section Dividers

For: landing page redesign · Reference: [legendsofkingdomrush.com](https://www.legendsofkingdomrush.com)

Hey — got the divider concept, love the seaweed + hidden creatures direction. Want to expand the ask so we tackle the whole "stage" treatment in one pass.

Reference: <https://www.legendsofkingdomrush.com/> — open it and zoom your browser out to 33% to see exactly the framing I'm chasing: dark crimson forest filling the gutter, content column floating in the middle, themed dividers between sections.

Three asset categories below.

1. Gutter Background — 1 piece

This fills the screen *outside* the main content column — visible when the viewport is wider than our 1400px stage, or whenever someone zooms out. LoKR uses a dark crimson forest pattern; ours should be the deep-ocean equivalent.

SPECS

- Tileable seamless texture, 2400 × 2400 px minimum
- JPG is fine (no transparency needed)
- Style: deep abyssal seafloor — dark kelp silhouettes, coral skeletons, anemones, very dark teal/black
- Low contrast on purpose — sits behind the main content, shouldn't compete
- Mood: "audience peering in at the action from outside the reef"

2. Section Divider Pairs — 3 pairs · 6 strips total

Each pair frames a content section on the landing page: **top** strip caps the section start, **bottom** strip caps the section end. Themed by ocean depth zone so the page reads as a descent from sunlit reef into the abyss.

PAIR A Coral reef / sunlit shallows — intro section

- Bright, welcoming, sunlit
- **Top:** shallow water above, coral + seaweed reaching down into the section
- **Bottom:** coral + seaweed reaching up, sunlight rays piercing
- **Hidden creatures:** small fish school, baby lobster peeking, seahorse, starfish
- **Vibe:** "welcome to the reef"

PAIR B Kelp forest / mid-depth — mining + battle showcase section

Center will be a faded battle screenshot we size in code.

- Medium tone, atmospheric, slightly tense
- **Top:** dense kelp fronds reaching down, lobsters peeking through, sand particles drifting
- **Bottom:** kelp rising from below, octopus tentacle curling in, schooling fish at the edges
- **Hidden creatures:** lobsters crouched in kelp, octopus, eel in a crevice
- **Vibe:** "the hunting grounds"

PAIR C Deep trench / abyss — get-started / faucet section

- Dark, mysterious, bioluminescent
- **Top:** dark rock formations descending, glow specks, dark coral
- **Bottom:** anglerfish silhouettes, glowing eyes in shadows, deep coral, tube worms
- **Hidden creatures:** anglerfish, giant lobster silhouette in shadow, glowing jellyfish
- **Vibe:** "you've descended into the abyss"

SPECS PER STRIP

- **Pairs A & C:** 3840 × 675 px @2x (slim, like your `separador-2` reference)
- **Pair B:** 3840 × 1600 px @2x (taller, embedded scene like `separador-3` — gives one section a fuller, more cinematic frame)
- Transparent PNG so the section's middle background shows through

3. Mobile Variants — 6 strips

Same art, narrower crop. Creature details get unreadable when CSS-scaled to phone widths, so LoKR ships these as separate files.

- ~1080 px wide per strip
- Crop the most character-dense portion of each desktop divider

LoKR Reference Files

- **Slim divider**

https://www.legendsofkingdomrush.com/images/generic/separador-2_3840x675@2x.png

- **Tall embedded-scene divider**

https://www.legendsofkingdomrush.com/images/generic/separador-3_3840x1600@2x.png

Total deliverable: 1 gutter texture + 6 desktop dividers + 6 mobile dividers = **13 files**

Once these land I can build the whole landing redesign in one pass. Timeline thoughts?
